Main hypothesis in Robust methods :

- Robust methods assume that the largest mass of data is  $X_0$  .
- The learning database is polluted

Main difficulties in Robust methods :

- Find a good measurement to highlight the outliers (especially when estimating leverage points)

## 5. Conclusion

The results highlighted the good predictive capacity of the RoBoost-PLSR method, however some points need to be developed :

- Weight functions
- Weight optimisation
- Weight combinations
- Development of metrics for weighting
- The presence of outliers in the test
- Interpretation of the meta-model
